SEARCH REQUEST FORM

Scientific and Technical Information Center 145769

Requester's Full Name: LANSANA MYALLEY Examiner #: 80552 Date: 02/23/05

Art Unit: 1621 Phone Number 30_____ Serial Number: 10/751,237

Mail Box and Bldg/Room Location: _____ Results Format Preferred (circle): PAPER DISK E-MAIL

5B21-5C18

If more than one search is submitted, please prioritize searches in order of need.

****

Please provide a detailed statement of the search topic, and describe as specifically as possible the subject matter to be searched. Include the elected species or structures, keywords, synonyms, acronyms, and registry numbers, and combine with the concept or utility of the invention. Define any terms that may have a special meaning. Give examples or relevant citations, authors, etc, if known. Please attach a copy of the cover sheet, pertinent claims, and abstract.

Title of Invention: _____

Inventors (please provide full names): _____

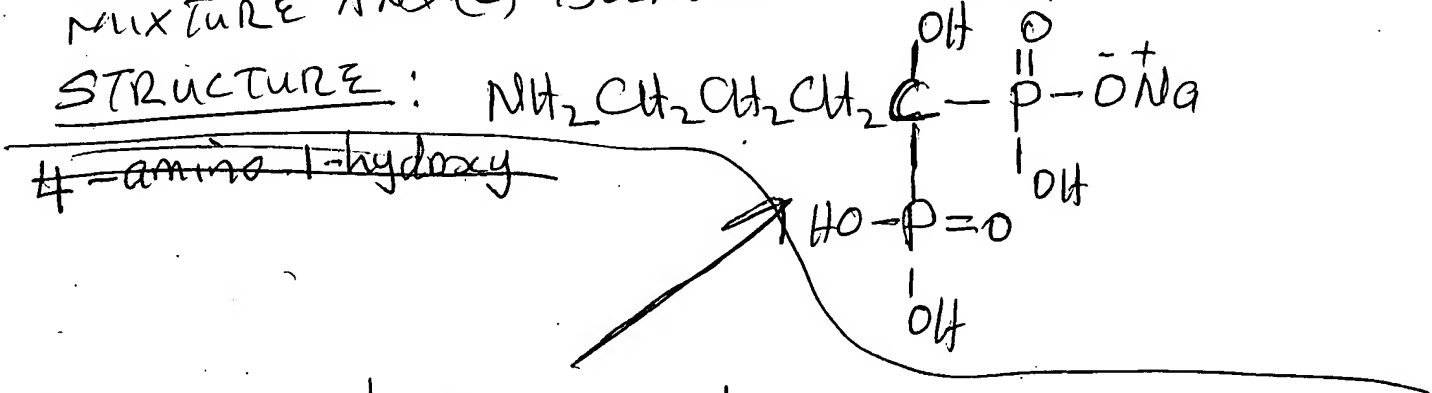
_____

Earliest Priority Filing Date: _____

**For Sequence Searches Only* Please include all pertinent information (parent, child, divisional, or issued patent numbers) along with the appropriate serial number.*

(A) PROCESS OF DRYING ALENDRONATE TRIHYDRATE COMPRISING: REFLUXING THE COMPOUND WITH ABSOLUTE ETHANOL; PASSING THE MIXTURE THROUGH A BED 3Å MOLECULAR SIEVES; RETURNING THE CONDENSED REFLUX TO THE MIXTURE (b) COOLING THE MIXTURE AND (C) ISOLATING THE COMPOUND;

STRUCTURE:



~~4-amino-1-hydroxy~~

4-amino-1-hydroxy-1,1-bisphosphonic acid monosodium

AB New hydrate forms of alendronate sodium, having water content of approx. 1-12%, and processes for their manufacture, are disclosed. New crystalline forms of alendronate sodium B, D, E, F, G and H, and processes for manufacturing them, are also disclosed. These new forms of alendronate sodium are suitable for incorporation into pharmaceutical compns. for combating bone resorption in bone diseases.

AB Provided is a method for preparation of high purity 4-amino-1-hydroxybutyliden-1,1-bisphosphonic acid monosodium trihydrate safely and cheaply in higher yield. The method for producing 4-amino-1-hydroxybutylidene-1,1-bisphosphonic acid monosodium trihydrate comprises the steps of: reacting gamma-aminobutylic acid with the mixture of water and triphosphorous chloride; recovering 4-amino-1-hydroxybutylidene-1,1-bisphosphonic acid or its salts; dissolving 4-amino-1-hydroxybutylidene-1,1-bisphosphonic acid in water with heat and adding sodium hydroxide into the 4-amino-1-hydroxybutylidene-1,1-bisphosphonic acid solution in a ratio of 0.9-1:1; and increasing the temperature of the reaction mixture to an appropriate temperature and slowly cooling the mixture

CC 8-9 (Radiation Biochemistry)
AB Bisphosphonates (BPs) are characterized by a P-C-P backbone structure and two phosphonic acid groups bonded to the same carbon, and are established as osteoclast-mediated bone resorption inhibitors. The nature of the groups attached to the central carbon atom are responsible in determining the potency of bisphosphonates as anti-resorption drugs. However, it is not yet clear the exact relationship between their mol. structure and pharmacol. activities. In this study, mol. geometries of pamidronate, alendronate and neridronate, differing only in the length of the aliphatic chains, were predicted by mol. mechanics and their interactions with hydroxyapatite, the main bone mineral component, were examined We report the synthesis and radiochem. characterization of 153Sm complexes with pamidronate, alendronate and neridronate. Hydroxyapatite binding and biodistribution studies of these complexes have shown a good correlation with the theor. mol. modeling interaction studies. So, it is possible to conclude that computational chemical techniques are a good approach to evaluate specific interactions and may play a relevant role in determining the relative ability of BPs to mineral bone, and open new perspectives to the design of new BPs with increased pharmacol. activity. These techniques could be extended to BPs as ligands to carrier radioactive metals, aiming for new bone therapeutic radiopharmaceuticals.

AB Disclosed is a bisphosphonate bone cement for preventing peri-prosthetic bone loss and aseptic loosening of a joint prosthesis in patients, which cement contains a bisphosphonate bone resorption inhibitor, e.g. Na or Ca salt of alendronate and a pharmaceutically acceptable polymeric carrier such as poly(Me methacrylate). A composition containing Me methacrylate, N,N-dimethyl-p-toluidine, and chlorophyll was added to a composition containing Me methacrylate-Me acrylate copolymer, benzoyl peroxide, ZrO2, chlorophyll, and gentamicin, then alendronate Na was added to give a cement mixture

AB The title cadmium and zinc alendronate complexes Zn[NH3+(CH2)3C(OH)(PO3H-)2]2.2H2O (I) and Cd[NH3+(CH2)3C(OH)(PO3H-)(PO32-)].H2O (II) were prepared from alendronate and ZnSO4 or CdCO3, resp. The structures of the complexes were determined by x-ray crystallog. (complex I, monoclinic, space group P21/c; complex II, monoclinic, space group P21/n). The study points out that the size of the cation strongly modifies the structure of the complex. With Cu(II) and Zn(II), which are cations with similar ionic radii, one cation is put in the center of the coordination system, and the structures are isomorphous. However, with Cd(II), a binuclear complex was obtained. Results are discussed on the basis of these structures..

AB Poorly soluble calcium alendronate salts were prepared and investigated as potential candidates for s.c. or i.m. formulations. Three such formulations containing calcium alendronate salts with different stoichiometries were developed for testing in safety, disposition and efficacy studies in animals. All formulations demonstrated a drastic reduction in pain on injection and tissue damaging propensity compared to the soluble salts of alendronate. All three were efficacious and showed prolonged absorption from the injection site with the deposition of a large percentage of the dose into the bone. Complex formation between alendronate and calcium was also studied.

AB An insol. bisphosphonic acid Ca salt, e.g. di[4-amino-1-hydroxybutylidene)-1,1-bisphosphonic acid] monocalcium salt (I), is formulated into an aqueous suspension for i.m. and s.c. administration in the prevention or treatment of Ca metabolism disturbances. The Ca salts provide a slow systemic release of the bisphosphonic acid and reduce tissue damage and localized pain and irritation. Thus, I was suspended in a vehicle containing Na CMC, NaCl, NaOc, and distilled water. S.c. administration of the suspension of I to rats exhibited a lower tendency to induce irritation at the site of injection, compared to the solution of [(4-amino-1-hydroxybutylidene)-1,1-bisphosphonic acid] Na salt (II), and the bone loss in rats undergoing immobilization surgery was less than the control group treated with II.

NOVELTY - A solid pharmaceutical dosage form (I) comprises a core tablet containing an active pharmaceutical ingredient sheathed in an annular body of compressed powder or granular material formed by compression around the core tablet.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are included for the following:

(1) a toolset (II) for producing (I) comprising a columnar punch and a punch assembly comprising annular punch and a core rod slidably engageable with the annulus of the annular punch. The core rod is capable of movement between a retracted position and an extended position. The core rod is biased in an extended position; and

(2) production of solid dosage form involving forming annular body of powder or granular material around core tablet by compression.

ACTIVITY - Antiulcer; Antiinflammatory.

MECHANISM OF ACTION - None given.

USE - For oral delivery of drug e.g. non-steroidal antiinflammatory drugs (claimed) that causes irritation or ulceration to the lining of esophagus and stomach.

ADVANTAGE - The solid dosage form releases drug to a predetermined release profile and reduces contact of the drug to the mucosa lining of the gastrointestinal tract.

NOVELTY - Oral pharmaceutical dosage form provides immediate or uncontrolled release of a vitamin D derivative (I) and delayed release of a therapeutic bisphosphonate (II) at least an hour after the release of (I).

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for:

(1) Combination therapy for treating a bone disease, comprising repeated administration of a unit dosage form that releases a calcium transport stimulator in an immediate or uncontrolled manner and, after swelling to a size that prevents passage through the pylorus and after a delay allowing the calcium transport stimulator to deplete the upper gastrointestinal tract of calcium, releases a therapeutic bisphosphonate in the stomach; and

(2) Combination therapy for treating a bone disease, comprising administering a unit pre-dose of a vitamin D derivative and, 2-6 hours later, administering a therapeutic bisphosphonate.

ACTIVITY - Osteopathic; Cytostatic.

No biological data available.

MECHANISM OF ACTION - None given.

USE - The dosage form is used for treating bone diseases, especially metastatic bone disease, osteoporosis, Paget's disease, hypercalcemia and bone cancer (all claimed) or for inhibiting bone resorption (claimed).

ADVANTAGE - (I) stimulates the transport of calcium from the intestine into the bloodstream, providing a low-calcium environment that will enhance absorption of (II) when it is released.

AB WO 200200204 A UPAB: 20040511

NOVELTY - A pharmaceutical dosage form for oral administration comprises a bis-phosphonate and a drug delivery vehicle which contains a non-hydrated hydrogel.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are included for the following:

(1) a coated pharmaceutical dosage form comprising a core containing the bis-phosphonate and optionally other excipient and a coating around the core containing the hydrogel, the superdisintegrant and tannic acid; and

(2) making of the dosage form involving mixing powdered **sodium alendronate monohydrate**, microcrystalline cellulose and lactose, tableting the mixed powders to make core, dry mixing the hydroxypropyl methylcellulose (HPMC), tannic acid, hydroxypropyl cellulose (HPC), and cross-linked carboxymethyl sodium to produce a coating mix, embedding the core in the coating mix, and compacting the coating mix.

ACTIVITY - Osteopathic; cytostatic.

MECHANISM OF ACTION - Inhibitor.

USE - For treating bone disease, e.g. metastatic bone disease, Paget's disease or osteoporosis, hypercalcemia, malignancy in bone and inhibiting bone resorption (claimed).

ADVANTAGE - The dosage form when contacted with gastric fluid or stimulated gastric fluid, hydrates the non-hydrated hydrogel and expands the delivery vehicle, thus provides delayed gastric release of the bis-phosphonate for at least 2 (preferably at least 3, especially at least 4) hours. The dosage form swells rapidly by a factor of at least 5

(preferably at least 8) within 15 minutes (preferably within 5) minutes of contacting aqueous solution. The dosage is administered in a controlled manner. The oral dosage form swells rapidly in the gastric juices of the patient, thus increasing the likelihood of the dosage to be released in the stomach or duodenum.

NOVELTY - 4-Amino-1-hydroxybutylidene-1,1-bisphosphonic acid monosodium salt (I) with a water content of 1.3-11.7% is new.
DETAILED DESCRIPTION - INDEPENDENT CLAIMS are included for the preparation of (I).
ACTIVITY - None given.
USE - Used for treating and/or preventing bone loss (claimed) including bone resorption in bone diseases such as in osteoporosis and Paget's disease.
ADVANTAGE - A 1-liter flask was fitted with a magnetic stirrer, Soxhlet extraction funnel (150 ml operating volume) charged with 3 Angstrom molecular sieves (60 g) and reflux condenser connected to a drying tube with 3 Angstrom molecular sieves. The flask was charged with **sodium alendronate trihydrate** (25 g) and absolute ethanol (450 ml, volume % of water less than 0.1%). The mixture was boiled with stirring for 24 hours. After cooling to ambient temperature, the solid material was filtered, washed with absolute ethyl ether and dried overnight in a vacuum oven (10-15 mmHg, ambient temperature) to give **sodium alendronate dihydrate.**

NOVELTY - Treatment of Paget's disease, abnormally increased bone turnover, periodontal disease, tooth loss, bone fractures, metastatic bone disease, hypercalcemia of malignancy and multiple myeloma comprises administration of a bisphosphonate (I) as a unit dosage on a continuous schedule one weekly, twice weekly, biweekly or twice monthly.
ACTIVITY - Osteopathic; antiinflammatory; cytostatic.

MECHANISM OF ACTION - Osteoclastic bone resorption inhibitor.
USE - (I) is useful for treatment of Paget's disease, abnormally increased bone turnover, periodontal disease, tooth loss, bone fractures, metastatic bone disease, hypercalcemia of malignancy and multiple myeloma (claimed).
ADVANTAGE - The dosage regime of (I) allows effective dosing of (I) while lessening the gastrointestinal side effects (e.g. gastric esophageal reflux disease, esophagitis, dyspepsia, ulcers, esophageal irritation, esophageal perforation, abdominal pain or constipation) associated with a chronic dosage regime of (I) at low concentration on successive days. The more widely spaced dosage intervals increase patient compliance.
Dogs were dosed orally with 50 ml simulated gastric juice containing **alendronate monosodium trihydrate** (Ia) by direct infusion into the esophagus at 80 mg/ml once weekly for 4 weeks. 7 Days after the last dose, the animals were sacrificed and the esophagus removed and prepared for examination (embedded in paraffin and stained with hematoxylin and eosin). Histopathological studies showed an intact epithelium with no inflammation or vacuolation, compared with deep ulceration, marked submucosal inflammation and vacuolation in animals dosed with (Ia) once daily for 5 days and sacrificed immediately after the last dose.

AB New hydrate forms of alendronate sodium, having water content of approx. 1-12%, and processes for their manufacture, are disclosed. New crystalline forms of alendronate sodium B, D, E, F, G and H, and processes for manufacturing them, are also disclosed. These new forms of alendronate sodium are suitable for incorporation into pharmaceutical compns. for combating bone resorption in bone diseases.

NOVELTY - 4-Amino-1-hydroxybutylidene-1,1-bisphosphonic acid monosodium salt (I) with a water content of 1.3-11.7% is new.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are included for the preparation of (I).

ACTIVITY - None given.

USE - Used for treating and/or preventing bone loss (claimed) including bone resorption in bone diseases such as in osteoporosis and Paget's disease.

ADVANTAGE - A 1-liter flask was fitted with a magnetic stirrer, Soxhlet extraction funnel (150 ml operating volume) charged with 3 Angstrom molecular sieves (60 g) and reflux condenser connected to a drying tube with 3 Angstrom molecular sieves. The flask was charged with sodium alendronate trihydrate (25 g) and absolute ethanol (450 ml, volume % of water less than 0.1%). The mixture was boiled with stirring for 24 hours. After cooling to ambient temperature, the solid material was filtered, washed with absolute ethyl ether and dried overnight in a vacuum oven (10-15 mmHg, ambient temperature) to give sodium alendronate dihydrate.
